## Education

**Columbia University | New York, U.S.** **Jan. 2021–May 2022**
*Master of Statistics* GPA: 3.97/4.0
Core Courses: Statistical Inference, Linear Regression Models, Time Series Modelling, Sample Surveys

**University of International Relations | Beijing, China** **Sept. 2015–Jun. 2019**
*Bachelor of Engineering in Management Information Systems* GPA: 3.73/4.0
Core Courses: C Programming, Data Structure and Algorithms, Principles of Database, Data Mining

**Peking University | Beijing, China** **Sept. 2016–Jun. 2019**
*Bachelor of Economics* GPA: 3.47/4.0
Core Courses: Intermediate Microeconomics & Macroeconomics, Econometrics, Game Theory

## Skills

**Hard Skills** MS Office Toolkit, R == Statistics > SQL > Python, Jupyter Notebook, (R)Markdown, Latex, RShiny, Data Visualization (ggplot2, seaborn), Hypothesis Testing, ML Models: Linear Regression, Logistic Regression, Tree-based Models, Neural Networks, Clustering

**Soft Skills** Self-learning, Multi-tasking, Solution-oriented

## Internship

**Teaching Assistant | Dept. of Statistics, Columbia University | New York** **Sept. 2021–May 2022**
- Reviewed homework and Q&A for undergraduate students on statistical theories and R coding

**Data Management Intern | Qichacha Tech. | Suzhou, China** **Jul. 2020–Oct. 2020**
- Took part in the design of a new section of bidding information, including determining the organization and features
- Collected data sources manually; Wrote SQL queries to check the data quality and communicated with the web crawler team to do corrections

**Assistant Analyst | TokenInsight Tech. | Beijing, China** **Apr. 2019–Jul. 2019**
- To identify the wash trading of cryptocurrency exchanges, proposed that the Power Law can be used to check the distributions of orders of exchanges, then identify the unusual patterns and estimate real trading volumes
- Realized the idea with R and Python using the raw order book data, validated its effectiveness by data manipulation, visualization, and curve fitting
- Analyzed dozens of exchanges, found the evidence of their washing trading, and estimated their real trading volumes; Finished writing the methodology, validation, and visualization parts in the final report

## On-campus Projects

**How To Increase Happiness** **2022**
- Preprocessed data using Python, like one-hot/label encoding, standardization, and aggregation of features; Modeled logistic regression and gradient boosting trees with the scikit-learn package, tuned the hyperparameters by grid search and cross-validation, evaluated them by F-1 score and ROC/AUC
- Extracted the common important features from them by coefficients and feature importance, found that comparison with peers, family and health are important, and gave corresponding practical suggestions

**Loan Origination Prediction/P2P Bad Debt Forecasting** **2021/2019**
- **(2021)** Did EDA and visualization by the ggplot2 package in R, balanced the dataset using SMOTE-NC algorithm, and used the FAMD technique to generate principal components for mixed data
- Modeled with logistic regression with L-1 regularization for feature selection; Did a simple performance comparison with random forest, XGBoost and ANN; Drove accuracy from 65% to 72%
- Did research about the credit domain and concluded the lack of key variables like credit history
- **(2019)** Similar preprocessing and modeling using R; Found that variables selected by the stepwise logistic regression performs better in neural networks

**Does the High Housing Price Lower the Fertility Rate** **2021**
- Collected and joined different data sources to generate a panel data; Preprocessing like imputing missing values and standardization in R; Did Visualization to check the integrity of data and understand the data intuitively
- Used fixed effect regression to deal with time-invariant confounders; Did literature review and determined time-varying confounders, like household wealth
- Inspected parameter uncertainties by grouping the data. Found that high housing prices don't lead to low fertility rates, and even have a positive effect in low-income regions and for rich families. Corresponding explanations given
